1. Lipschitz Function

Consider two metric spaces (Z, d_X) , $(\overline{I}, d\overline{J})$, and a function $f: X \to \overline{I}$, If $\forall x_1, x_2 \in X$, it holds that

 $d_{\Sigma}(f(x_1), f(x_2)) \leq k \cdot d_{\Sigma}(x_1, x_2),$

then f is k-Lipschitz.

2. Bi-Lipschitz Function

If there exists $k \ge 1$ s.t. $\forall x_1, x_2 \in \mathbb{Z}$,

 $\frac{1}{k} d_{\mathbf{x}}(\mathbf{x}_{1}, \mathbf{x}_{2}) \in d_{\mathbf{x}}(\mathbf{f}(\mathbf{x}_{1}), \mathbf{f}(\mathbf{x}_{2})) \in \mathcal{K} d_{\mathbf{x}}(\mathbf{x}_{1}, \mathbf{x}_{2}),$

then f is a bi-Lipschitz function.

3. Doubling Space

A metric space (\mathbb{Z} , d) is said to be doubling if there exists some doubling constant \mathbb{M} such that $\mathbb{X} \times \mathbb{Z}$. r > 0, the ball $\mathbb{X}(x, x) = \frac{1}{2} \times \mathbb{Z}$: $d(x, y) \leq r$? Wild be cover with the union of at most \mathbb{M} balls of radius $\frac{\pi}{2}$.

Remark. The doubing constant of 1-dimensional Euclidean space with the Euclidean metric is 2, (2-dimensional =) 7).
